1 People

In this section we specify the insight we got from the initial stakeholder analysis and stakeholder research.

1.1 Users

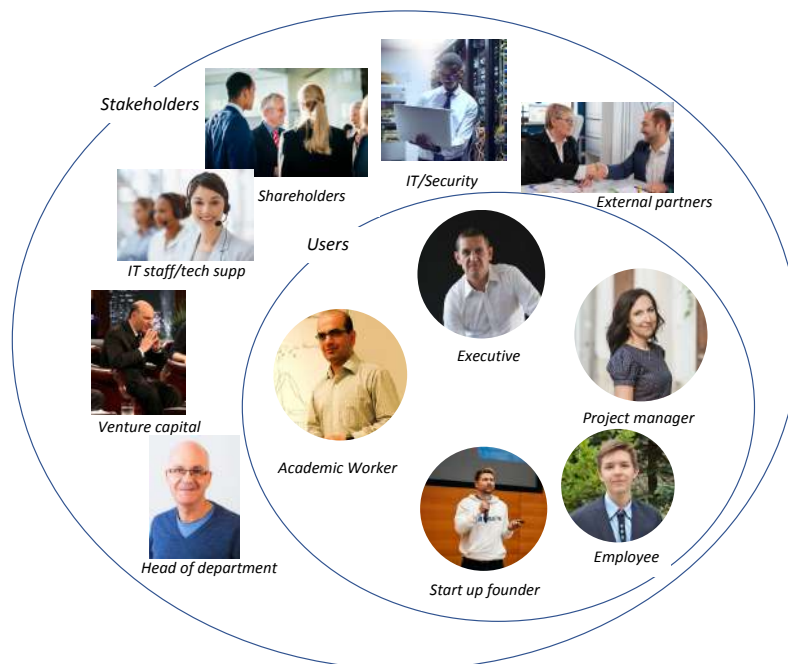

- Employee - The employees are often invited to meetings during which they are not needed or momentarily needed, which causes them not to have time to do their actual work.
- Project manager - They currently have no way of knowing who to invite to meetings or the participants' opinion of them.
- Executive - They often are invited to meetings in case they need to make a decision, which, most of the time, they don't need to do. This leads them to have a lot of their time wasted and having to pay for it with their personal lives.
- Academic Worker - They encounter issues similar to the company employees; however, this is much less prevalent in small teams they do work in.
- Startup founder - They do not have a problem with meetings at all since most problems can be solved with some degree of micro-management.

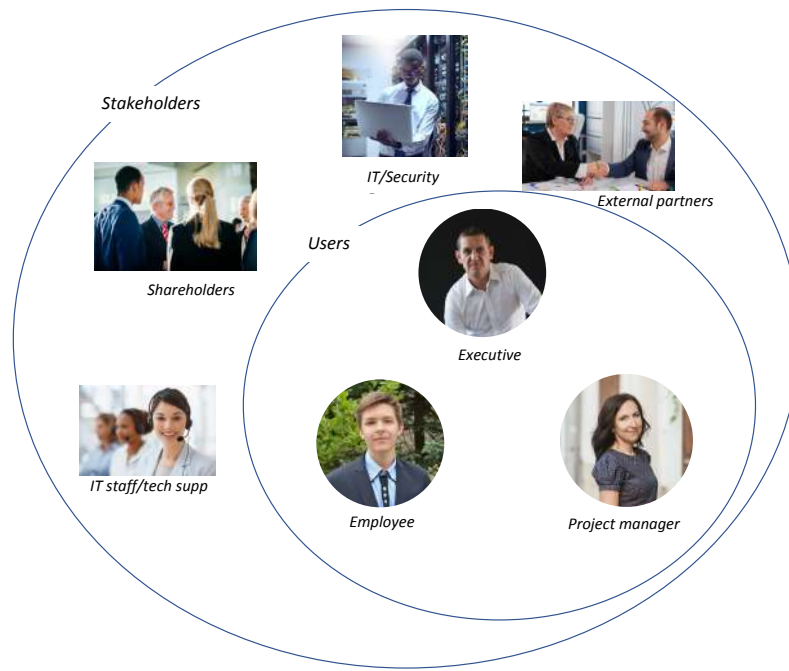

1.2 Stakeholders

- IT/Security Team - Has to approve of adding our solution to the company's system.
- Shareholders - Are interested in the company's performance, which currently has a lot of room for improvement.
- External partners - They sometimes are frustrated at the other company's employees derailing the meeting with them.
- Venture Capital - Want the startup to thrive, but proved irrelevant since we didn't end up including startups in our final opportunity
- Heads of the departments - Want the research to be done efficiently and thus for Academics to do their job efficiently, but proved irrelevant since we didn't end up including startups in our final opportunity

1.3 Stakeholders Map

The following stakeholder maps introduce the relevant users and stakeholders before and after initial testing, showing how we narrowed down the scope of our project.

1.4 Personas analysis

Here is an illustration of our persona analysis after the user research

Personas

Agile team developer - Natalia (38)

Passionate about her work, cares about her project, manages the project and agrees on internal meetings with the rest of the team, has some external meetings with upper management on which they discuss potential new additions. Values her time and would rather spend her time working on the solution than wasting it on meetings.

Problems:

- At the beginning of the projects it takes some time to start having useful meetings
- On meetings when she only needs to say a few sentences she has to stay for a whole meeting. She will work on her own task during that time, but has to also focus on the meeting so doesn't do a good job of either.
- Hates hybrid meetings because they create an imbalance of participation.
- Does not like when people keep talking without achieving consensus

- Sometimes has to stay in a meeting rather than follow up with notes in order to have the engagement boosted

Lower-level manager - Eduardo (30)

Works 9am - 5pm, not that experienced, has part of his time filled with meetings and part with non-meeting work (like planning the project), has to manage his subordinates that don't really care about the quality of meetings and only care about staying employed. Uses meetings to synchronize information rather than as a core part of their work. If a meeting does not concern him then he can just read the notes from it.

Problems:

- Does not know who are the right people to invite to meetings, so invites everyone
- Does not know how to moderate the meeting well, or does not think about doing that actively
- Sometimes is unprepared for a meeting which causes the meeting to become a brainstorming session.
- Often people don't prepare for meetings, so the whole meeting is wasted on explaining the topic

Presidents/high-level manager - Chad (50)

Has a flexible time schedule, though it is usually packed full after COVID (to the point of taking overtime). This is caused by Eduardo's inviting him to too many meetings, which, in turn, makes him have to choose between those meetings. His work consists of solely attending meetings, providing expertise and making decisions.

Problems:

- Often, Eduardo's invitations are not necessary - either he is not needed, the meeting is not effective at all or he is only invited as an engagement booster
- Moreover, meetings not being effective waste company's time and resources
- Often the clients send people that can't make any decision over the relationship, thus rendering the whole meeting pointless
- Often Eduardo don't prepare for meetings and his time is wasted even more
- Has too many meetings, which causes him to lose performance and forget about basic needs
- Sometimes only has to participate in the meeting for a short while, but has to stay in them for the whole duration because he does not know when he needs to speak
- Does not get good notes from Eduardo, so has to come to meetings rather than just reviewing the notes afterwards
- Sometimes his meetings go over time, which throws off later meetings

- Sometimes his meetings go under time, so the rest of the time that could be used for another meeting is wasted
- Online meetings provide less tangible interaction
- Offline meetings are harder to arrange (either require more travelling or there is not enough meeting rooms)
- Also hates hybrid meetings because of communication issues
- Because of overlooking he cannot take a proper care of himself during the work day.

2 Current/Future State

Throughout our initial research, during Milestone 1, we did 10 meetings approximately 30-60min each, during which we found out about what different users/stakeholders of our solution struggle with and what we could potentially improve on. After each meeting we followed it with another hour of analysis, which we then included in the summary of that meeting. Later in the milestone we gathered all those findings together and compiled our opportunity statement.

2.1.1 User journey analysis

Agile Developer's Day

Engage	Purpose(s)	Meaning (Meaning)	Writing Summary (Writing Summary)	Travel between (Travel between)	Organizing Project (Organizing Project)	Reading notes (Reading notes)
Daring	Preparing/reading the agenda for the meeting, taking notes to make sure	Education's increase in attendance and increase in participation. People are not afraid to speak up and share their ideas. People come prepared and the meeting is successful. A lot of people are involved and everyone is participating. Some time is much better than others.	Summary of the topics discussed and action items. The meeting was successful and everyone was involved.	Driving, making sure to be on time for the meeting. The meeting was successful and everyone was involved.	Thinking of the plan for the project. Making sure to be on time for the meeting. The meeting was successful and everyone was involved.	Trying to price the project. Making sure to be on time for the meeting. The meeting was successful and everyone was involved.
Education's Emotions	A lot of conflict, some difficult, sometimes happy. In the end, everyone is happy to be in the meeting.	People are happy with the meeting and everyone is involved. The meeting was successful and everyone was involved.	Barney, sometimes, does not do it.	Arranged on staff, some on staff.	Like doing it, his main job.	
Chief's Emotions	He is not happy, he does not like the meeting. He is not happy with the meeting.	People are not happy with the meeting and everyone is involved. The meeting was successful and everyone was involved.	Barney, sometimes, does not do it.	Arranged on staff, some on staff.	Like doing it, his main job.	Does not like the meeting. He is not happy with the meeting.

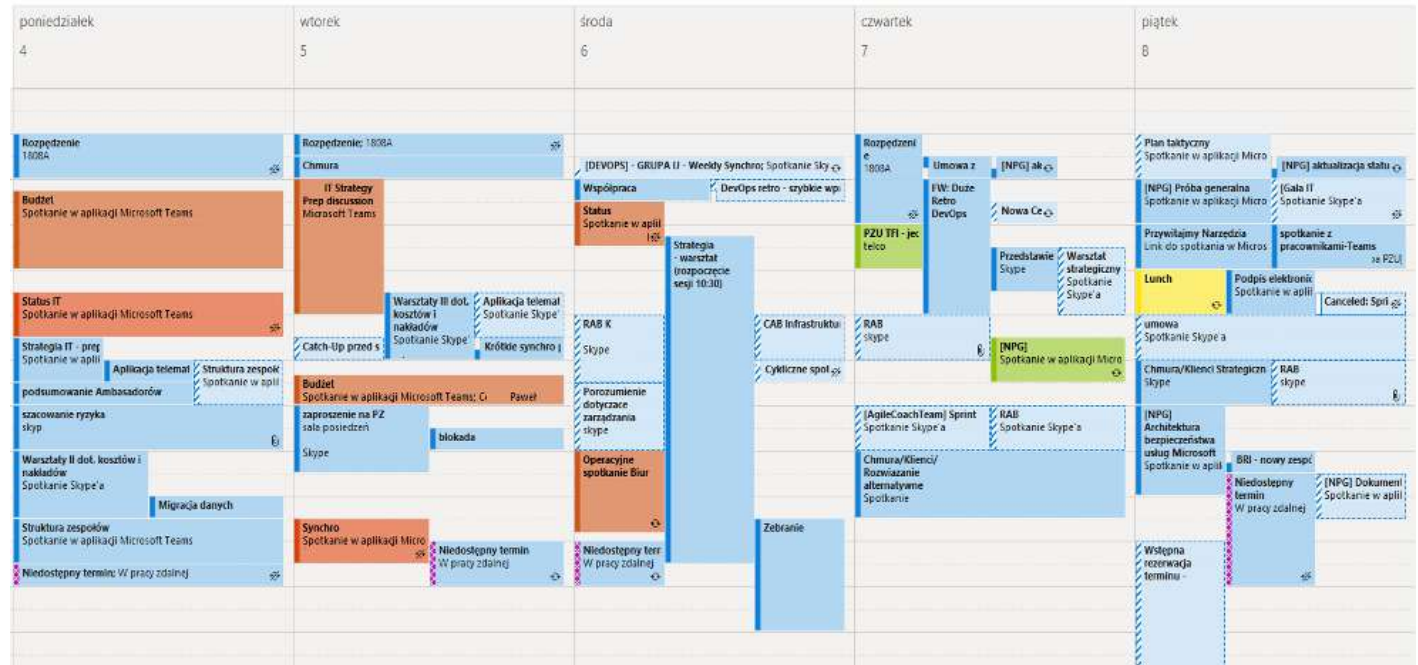

“First project meetings sometimes have as many as 60 people invited” Tomasz Żelski - CDO @ PZU
 ”Often times I don’t need to be present in the full meeting, just for a short while” Michał Szolucha - Senior Software Engineer @ NVIDIA
 “Often I have to come in to a meeting not to say anything, but to listen to it because of lack of good summaries later” Orest Korenevskij - CRO @ Kredobank
 ”Often people get invited to meeting unnecessarily, which just causes them to do anything but listen to the meeting” Oleg Usenko - CIO @ PZU Ukraine

"Often meetings are escalated too high on the corporate ladder, which causes us managers to attend meetings our subordinates could easily handle" Olena Kushay - Director of banking systems support @ Kredobank

"People can only focus for a limited amount of time; things like email or texting really impede that" Dariusz Przeczek - Senior Sales Executive @ RedHat

2.1.3 Calendar of an executive we interviewed

The calendar shows clearly that having a lot of meetings and overworking is an issue among executives.

2.1.4 Example of interview notes

Here is an example of the notes from an interview we did with a startup owner:

Meeting with Daniel Spica

Summary

1. The internal meetings are effective most of the time because people are trained for that.
2. With clients, if the clients brings people who don't really have a power over a meeting or can't make decisions in a meeting - does not depend on the company
3. Engineers are trained to alleviate this a bit
4. Reasons behind better management of meetings:
 - a. Since people don't have a set salary, they are more incentivized to work more efficiently
 - b. More ability to micro-manage - smaller company
5. In online meetings compared to in-person meetings:
 - a. People are more likely to be on time to the meeting
 - b. People don't take breaks between the meetings, thus may be more distracted even if they are trained against that
6. Advice: *Primarily try to show that your product will actually be useful (first code most useful features rather than the most core ones)*

Raw Content

- Type of meetings
 - 12 People in the company.
 - Internal: Daily meetings (morning) plans for the current day, for the whole company. Also got board meetings online. Some project meetings and also monthly company meetings discuss current profits and situations and projects and development, and financial status as well.
 - External: prospects, customers, our partners providing techs. Some companies provide services RG, marketing (organising conferences). Organise meetings with decision-makers and Potential customers (opportunity to present our offers; sales meetings).
 - Training (online), e.g. DevOps for the last 10 weeks. Regular 1.5h meeting per week with guys who paid for the meeting. Using zoom in this situation. Gather materials (e.g. recordings) using Teams.
 - Mostly using Teams with Microsoft365. Do not like teams 5 yrs ago, but now think it is good. Mostly online meetings, but 2/3 times per week in the office for the meetings.
- Efficiency
 - COVID changes the habit of remote meetings, e.g. meetings with prospects, people could be late, but with remote meetings, people arrive on time (1-2 min late at most). Also dangerous because they don't have other times except for consecutive meetings.
 - People are usually concrete with my meeting, but aware of engineers with very ineffective meetings who just spend time on meetings and do not care if value is brought (a busy façade). So depends on the quality of the participants (place in the hierarchy). I need to be effective since nobody pays me; otherwise easily go to the mood and waste time since money is paid from above. Depend on the goal of the person (internal motivation).
 - Training helps saving times and increase efficiency: what should be discussed, who will participate, and why (what they brings). Push our people to think about the meetings, as organised as possible, having this mindset during planning. Typically asking people what's the reason for these meetings and how to achieve results, whom do they need to achieve them, and what needs to be done.
 - Meetings in the morning to review yesterday. How to achieve goals that are not achieved yet.
 - Do not want to tell people what they should achieve, but listen from them and let them tell.
 - Unprepared: (with customers) Unplanned agenda can be less effective with a bunch of blabla. Got some prospects, when meet with them, usually boring and useless. Spend with a prospect for 1 year, last meeting broke up and push them to the corner for them to make some decisions. Some customers are like this, but not usually.
 - Internal usually effective. Manage agenda and ways of communication well. Focus well on what want to achieve. Allow/disallow some to participate considering the value they can bring.
- Advice: Don't like the word start-ups (burn money in fire for years). In normal economy, companies have to earn money on their own and prove the usefulness.
 - Think about the audience of the pitch.
 - Try to think about solutions that prove themselves in a short amount of time. Need to earn money.

2.2 Insights

Here is a selection of insights we gathered from our initial user research. Throughout our research we found that the issue with meetings was more prevalent in bigger companies and applied neither to startups nor to small stand-alone development teams. Thus in the next milestones we focused solely on middle to big sized companies and the stakeholders related to their operation.

Initial Insights from Meetings

Effective meeting (Micha, Mr. Z, Mr. K (Academic), Janusz, Orest, Darek, Olena, Tomek, Oleg)

Not inviting people too high on the corporate ladder

- Only needed when meetings actually need them to do something
- Only for decision-making or problem-solving
- Exception: when brainstorming about what to do with the company (e.g. board meeting)
- **(Olena)** Sometimes they will send relevant subordinates to summarize the meeting and add something on behalf of the higher-up

Inviting people that are actually needed in the meeting

- People who shouldn't be invited:
 - not related to the topic
 - no executive power
 - don't understand the meeting topic
 - don't say anything
- PMs often invite a lot of people not related to a meeting "just in case" because they don't know who's needed
- **(Tomek)** over-inviting is often done in PZU at the start of the project and then whittle people down
- if people aren't prepared and need to be then it results in derailing purpose of meeting and waste time catching up
- *(Maybe have some self-assessment questions, or questions about the necessity of others to be in a meeting)*

Preparedness of a PM for a meeting

- Should have the agenda set and prepared and follows it (if not then it just becomes a brainstorming session and usually wastes the higher-ups' time)
- Should send the agenda/topics of the meeting for people to read beforehand
- Should moderate the meeting if he sees that people keep talking without reaching any conclusion (they sometimes don't do that) *(can't moderate if a higher-up is saying sth)*
- *(They could cut people off in that situation or use the team mute(-all) button)*
- Have attendees rate the meeting leader: how prepared, if people were necessary etc; ask people general questions that would help the meeting leader

Having to participate in a part of a meeting, but only for a short time

- They either do nothing during the rest of the meeting or do their work
- If they do their own work then they have to split focus between work and listening to a meeting *(suboptimal)*
- *(Maybe split the meeting into smaller meetings or only have them come for the part they need to come for)*

Meeting delivery

- The meeting was short and to the point
- It does not go over time (which would throw off the later meetings, but not necessarily since it can be coordinated live or the meeting can start if the participant is not crucial)
- It does not go under time (is not allocated an hour while only taking 15 minutes) (makes people not be able to have other meetings during that time)

Miscellaneous

- If people that need to give their input in a meeting don't and give it too late (after several meetings) the workflow is thrown off
- *(Maybe have the software automatically rate your meeting, whether it was useful and stuff)*

Differences between relationships with meetings

Agile vs Waterfall

- **(Micha)** NVIDIA has a higher quality of employees who care more about the projects; also, they have a more mature culture and workflow
- **(Micha) (Mr. Z)** In Agile environments, the people care about the meeting quality, therefore they constantly improve it.
 - Mostly they have problems at the beginning of the project.
 - Then they develop some culture that decreases meeting overrun.
 - Happens because they are already experienced with those meetings and know how to focus on them.
- **(Micha)** In Agile where people have invested in the project themselves, lead the meeting themselves, and organize the workflow themselves.

- **(Micha)** In a Waterfall project, people just do their own thing and the meeting is more to monitor stuff.

Higher-ups vs lower-ups

- **(Tomek) (Olena) (Janusz)** There are 2 types of relationships to meetings in a company:
 1. Lower-level management and employees - meetings are just a way to transport information, do not form the majority of their work (though still more than a developer)
 2. Upper-level management and executives - meetings are essentially the way they work; if there are no meetings then they don't /can't work
- **(Olena)** For higher-ups, sometimes it is important to be throughout the whole meeting, even if they themselves participate in only a part of it since they want to hear others' opinions on the matters, which are likely not to be included in a meeting brief

Start-ups

- **(Daniel)** With a company slightly bigger than a startup (~12) you can still manage the people and make sure they are trained for meetings, although less so
- **(Mr. Z) (Pawe)** Startup meetings are usually more informal and can be managed more tightly and on the go (many combinations of tools used, organized on the fly, etc.) since there are fewer people (<5); *(have more superficial problems that we can't really solve)*

User story around a meeting

- **(Janusz) (Darek)** Meetings usually follow a set structure to them:
 - Creating and sending a meeting agenda
 - Covering the topics/agenda
 - Creating some notes on the meeting/meeting summary (e.g. Google Docs)
- **(Mr. Z)** With a structured list of points of a meeting, one can gauge how much time each point will take *(Proves feasibility of the solution for the people only need to be in a part of a meeting)*
- **(Olena)** Often the summaries aren't made for meetings when they would be really useful
- **(Mr. Z) (Tomek)** They use their notes to keep track of what people need to do; also, on the next meeting they will check if the people have actually done their tasks

Improving Engagement

- **(Tomek)** People sometimes invite the higher-ups just to make people engage more in meetings
- **(Micha)** ~~People think~~ that they can improve others' involvement by having them in the meeting rather than make them follow up with notes.
- **(Tomek)** People sometimes attempt to enforce engagement by making them turn on their cameras *(maybe not necessarily the most optimal solution)*

Differences between online vs hybrid vs in-person

- **(Darek)** Offline meetings allow for faster communication and more tangible interaction + better flow of information *(think interaction graph being a clique vs a star)* *(add a feature to allow for adding photos of things in place of notes)*
- **(Micha) (Janusz)** Hybrid meetings are usually bad because they put the attendees in an uneven power balance (they are left out of the conversation), or create a difference in reception quality (bad meeting quality vs seeing someone in person)

Online meetings

- **(Tomek)** COVID caused people to have more meetings (don't need to find rooms or travel places)
- **(Tomek)** Having more meetings means things are being done much quicker, but also decreases performance after a long day
- **(Tomek)** Having too much ease with meeting booking means that, if a day is overbooked (more than one meeting at the same time) then some meetings have to be rejected
- **(Tomek)** There is not really time to take notes or review them before/after the meeting, because there are so many meetings
- **(Daniel) (Tomek)** In online meetings people don't take necessary breaks between them (drink, pee, etc.), which may decrease performance

Insight into technologies & Integration

- **(Darek)** Most clients use teams because of better security compliance than other solutions
- **(Mr. Z)** Likes to take notes in Markdown, but there is no solution that integrates with teams.
- **(Janusz)** Does not use integrated solutions for meetings since the people he has meetings with often use different solutions; prefers standalone solutions
- **(Micha)** Use google docs for taking notes because it's simpler
- **(Orest)** Usually takes his notes on something simple like a paper notepad

- (Mr. K) In academia people don't have a constant paycheck; rather, most of their money comes from project funding and investment
- (Orest) If the meeting did not come to any conclusion, they move on rather than repeating/extending the meeting (there simply is not enough time)
- (Daniel) (Darek) It's often the clients that make inefficient meetings (people without enough power over the topic), but it can't sometimes be improved because no integration with a client + good relations is more important.
- (Orest) (Janusz) He often needs to listen to a meeting regardless of whether he needs to say sth or not, though, if good notes were available, they would be able to instead just read the notes (something relevant to him may be said)

2.3 Opportunity

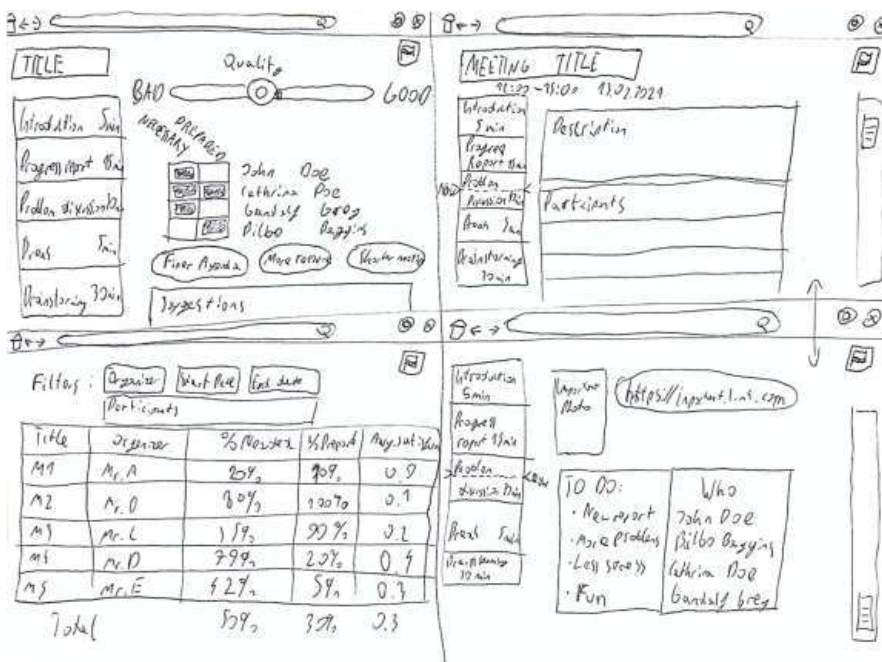

After identifying the 3 types of users we would target (employees, managers and executives), our opportunity statement became: "Improving the quality and efficiency of online company meetings for executives, project managers, and employees".

3 Testing and Validation

3.1 Milestone 2

3.1.1 Paper mockup

We created a paper mockup to be able to present it to users as quickly as possible and keep the cost of change small.

3.1.2 Mockup in Figma

After receiving user feedback we switched to a digital mockup made using Figma to make it resemble the final product more while still keeping the cost of change small.

Changes made:

- Added a more visual data representation (pie chart). A user said that if the manager is to analyze the data quickly, it needs to be presented in a visual format. ("It would be nice to have a visual representation of the collected responses. Maybe you could include some sort of a diagram or chart." - Adam Bistram).
- Removed the TODO list. A customer pointed out that they personally wouldn't use our app during the meeting (it would be distracting) hence we shifted our focus to the period after the meeting has ended. Hence the TODO list

was no longer needed. ("Keeping track of the tasks during the meeting seems like too much work for the participants. You need something simpler." - Michał Szolucha).

Additional Comments

Submit Review

3.2 Milestone 3

During milestone 3 we refined the user journey throughout our application.

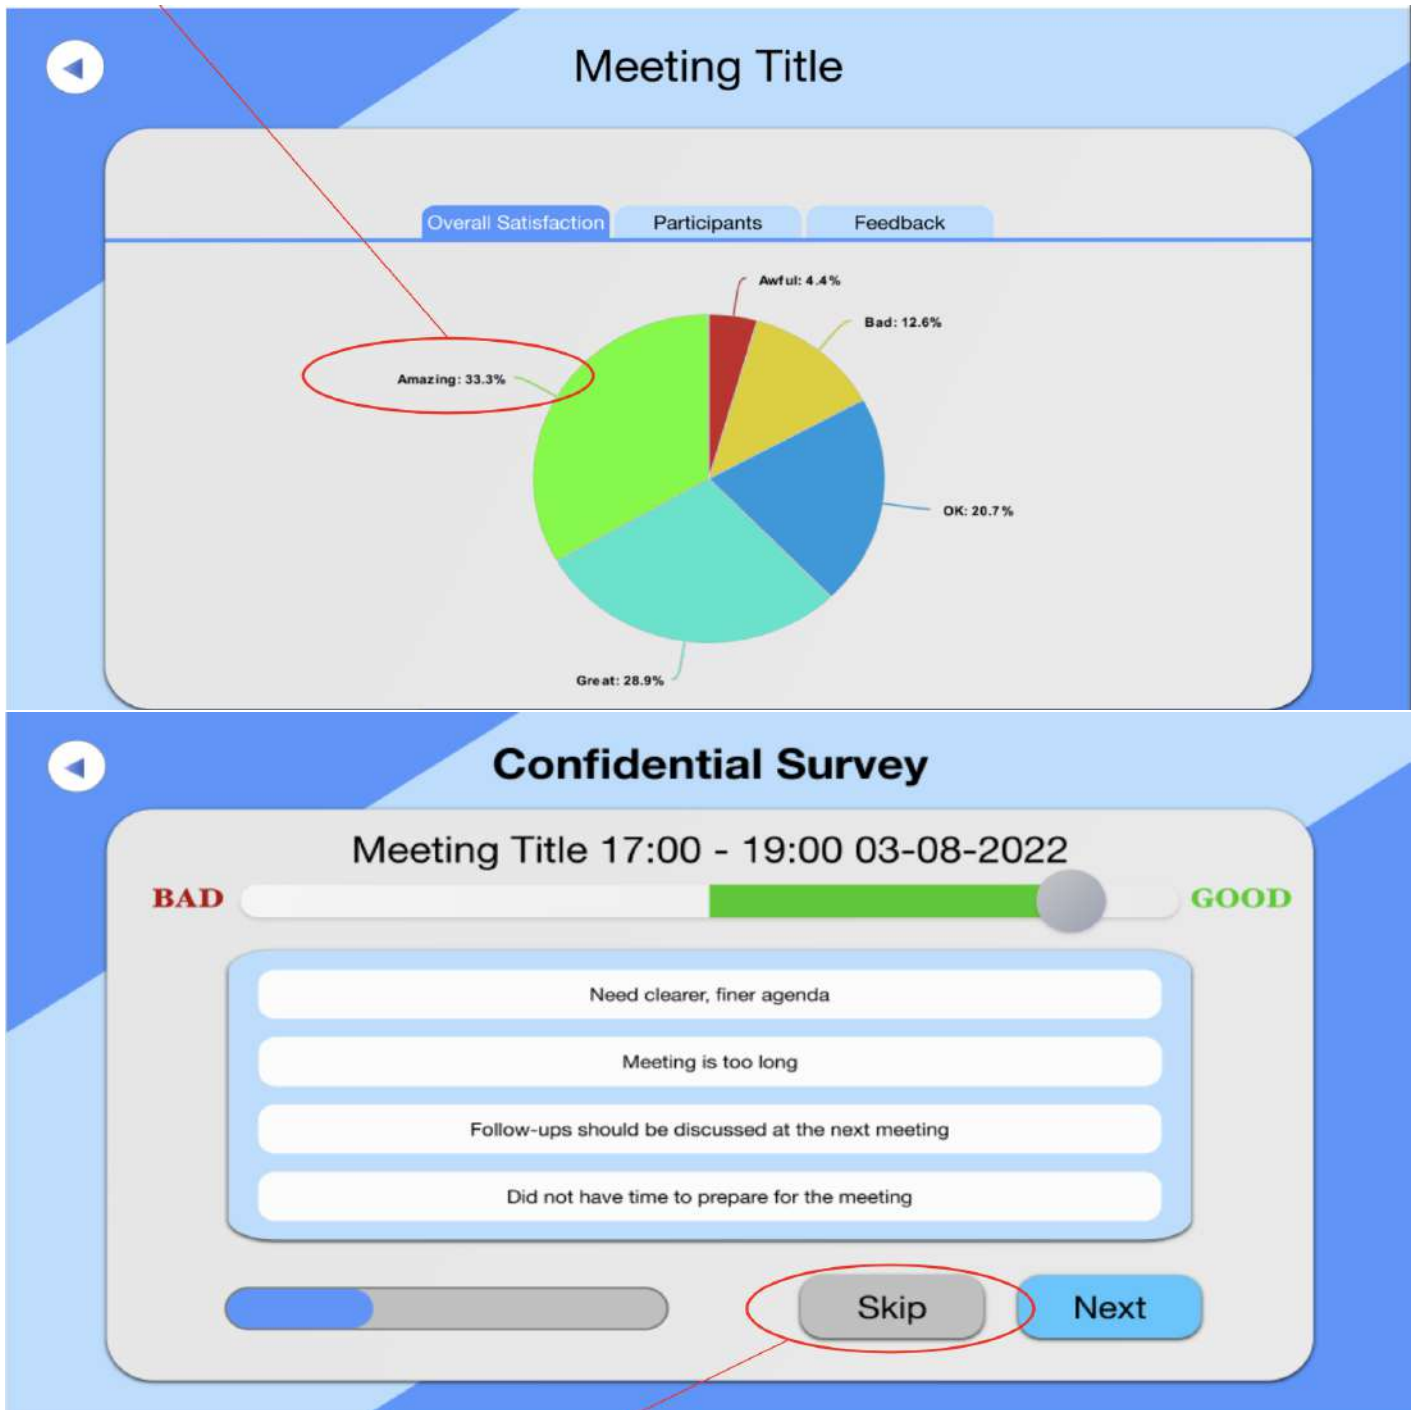

Changes made to the product:

- More neutral response options - more neutral perception of the survey. The users thought that having a label of "Not needed" sounded a bit harsh and wanted to have a neutral option for situations where they don't have an opinion. ("Prepared and needed, yes no, rather than having nots in there. It just has a slightly nicer feel to the questions even though the question is the same" - Adam Bistram)
- Improve user's feeling of safety. Users reported to us that people might not give feedback if they are not anonymous. ("People will be shy from answering, they will be intimidated to a certain degree" - Adam Bistram)
- Easier to process – human-readable categories. A client suggested that for the pie chart we don't use categories like "60-80 %", or "80-100 %" but instead names like good or excellent. ("For example excellent or very good or very satisfactory for 80-100%. You need layman terms for everything, not mathematical ones." - Adam Bistram)
- Reduced ambiguity if multiple meetings. A user noticed that he might have several recurring meetings with the same title, which might be confusing. ("I would add not only the meeting title but also its date and time. Sometimes I have the same survey and I think: Oh god, which training was it? I had one in the morning and one in the afternoon." - Marcus Matthews)
- Save time by only inputting relevant data. In the initial user testing users wanted the survey to take 40s to fill out and in this milestone another user suggested that people might not want to fill out all sections of the survey. ("The thing that will take more time you can skip", "These things are created window after window" - Orest Korenovskyy)

3.2.1 Early-milestone mockup

The mockup shows a survey form titled "Meeting Title" with a blue header. Below the title is a progress bar with "BAD" on the left and "GOOD" on the right. A red circle highlights a section of the form containing four feedback options: "Need clearer, finer agenda", "Meeting is too long", "Follow-ups should be discussed at the next meeting", and "There are agenda points not covered". To the left of this section is a 4x4 grid of checkboxes, with the first two columns labeled "Not Prepared" and "Not Needed". Below the grid are four names: Luke Skywalker, Jacen Solo, Darth Bane, and Count Dooku. At the bottom of the form is a text input field labeled "Additional Feedback" and a blue "Submit" button.

3.2.2 Final deployment for the milestone

Meeting Title

Overall Quality Participants Feedback

"I found the meeting very productive and everyone participated well"

"CEO should be fired"

"Please could the meeting be earlier next time"

"People are spending too long arguing"

"The meeting is pretty inconsistent and the agenda points are not followed. Since it is a daily meeting, we should find ways to make it more effective"

3.3 Milestone 4

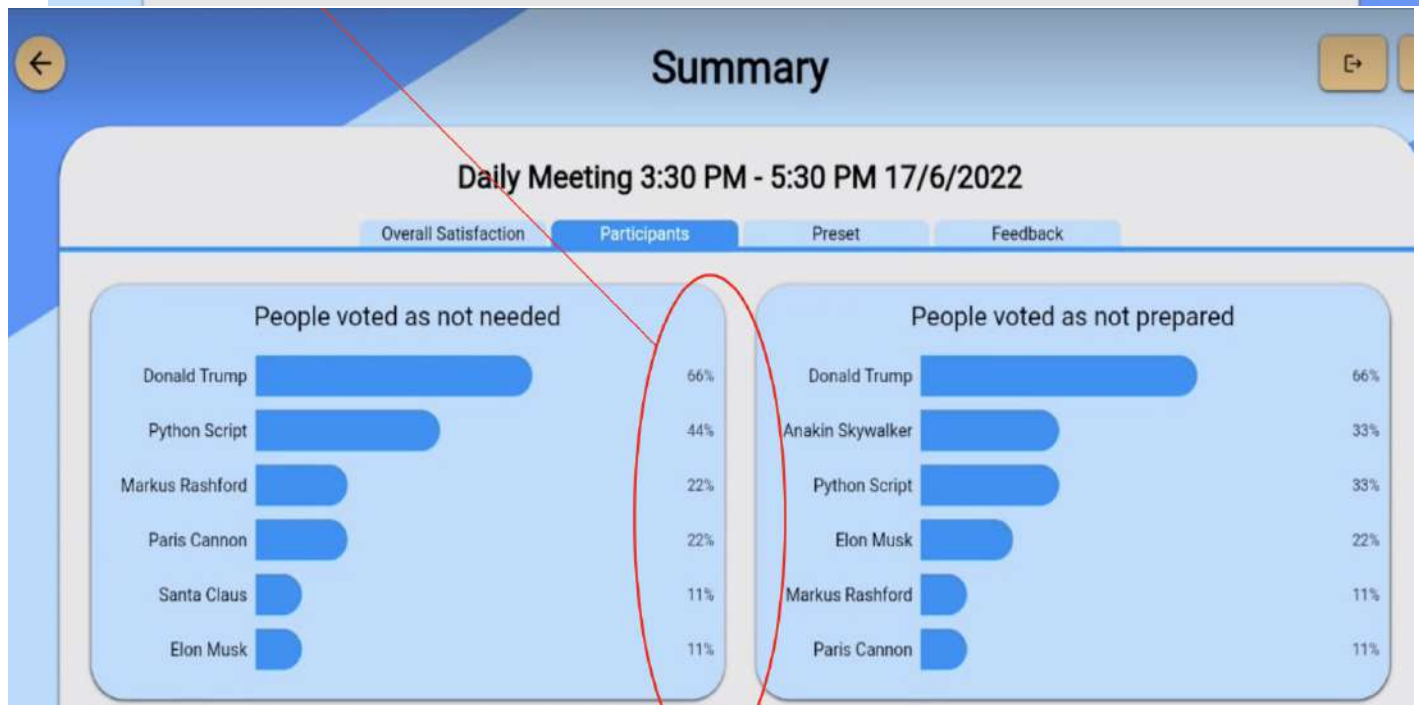

In milestone 4 we made our app more intuitive and increased accessibility by adding a Teams integration, for which users asked us already in milestone 1.

Changes made to the product:

- Tailor the survey questions to the organisation. A user pointed out that each organisation and department have specific things they are interested in so they should have an option to tailor the questions they ask the participants. ("Would you personally use that in your daily meetings?" "Absolutely, with my customers. So for companies like AWS, like Google, like Microsoft that would be a really useful tool to gauge the level of satisfaction, level of usefulness, the level of quality. Certain questions could be tailored over time. I would deploy machine learning to

aid this application.” - Adam Bistram)

- Improve data insight. A client mentioned that it’s hard to interpret data knowing only the votes but not knowing the total number of votes or total number of participants. (“Is it intuitive for you, I mean the results? For me, it’s not. They are not intuitive enough because you don’t know how many people are in the meeting when you are looking at the results.” - Przemysław Guzik)
- Improve consistency. A user said that the UI is ugly and not intuitive because there’s a big gap between buttons. (“You’ve got some filters on the left and some on the right. It would be better if they all were together.” - Rebecca Femenella)
- Added entry point through URL after meeting. A client suggested that it would be convenient for him to access our app straight from Microsoft Teams. (“Right after the meeting, pop up some questions.” - Dariusz Przeczek)
- Added call to action. A user was confused because he didn’t know what certain buttons meant. He would find a bit more explanation helpful. (“Just realise how it works and where is the proper place to put his mark or any other information.” - Krzysztof Błaszcyk)

3.3.1 In-field testing at Kredobank

Here is an example of the testing we did with Kredobank.

3.4 Selected interview screenshots from all milestones

4 Understanding Impact

4.1 Users

- Employees: They will spend less time in meetings, which for them means more time to do their primary work, which is what they prefer to do.
“I really hate those weekly sync-ups during which I am almost never needed, so maybe now my manager will finally notice that.” - Michał Zientkiewicz
- Managers: They have an easier time figuring out problems with their meetings. In the long run, this leads to shorter meetings, participants more satisfied with their work and a better intuition regarding future meeting organization.
“I can now see which exact meetings during the week employees are unhappy with.” - Connie Verbruggen

- Executives: They spend less time on unproductive meetings, have their calendar a bit freed up. This means for them higher job satisfaction thanks to having more time to work on improving the company and having a better work-life balance and, thus, mental health.
"I can now focus more on my family and less on meetings that I don't need to be in" - Artur Cieślak

4.2 Stakeholders

- IT/Security Team: They will need to approve our app, so it is crucial that the solution is secure in terms of the company's data. **"In order to approve the app for usage in our systems it needs to be well pentested"** - Artur Kuliński
- Shareholders: Since they are primarily concerned with the profitability in the company, the increase in productivity and better spent time across the entirety of the company means better fulfillment of their goals. **"I am confident there will be money saved across meetings in the long-term."** - Łukasz Węgrzyn
- External partners: Since the higher placed managers and executives have more time to work on improving the company, this also means that they have more time to talk to the external partners. **"We hope that our partners start using this app and stop derailing the sales meetings"** - Dariusz Przeczek
